## SUPER\_BM\_SIMULATION

Super Brownian motion is also called *superprocess* in the literature. Check out the Wikipedia page for [Superrprocess](#) and the book by Etheridge [\[Eth00\]](#).

### 1.1 Module contents

This module simulates branching Brownian motions and includes a variety of functionalities:

- **Simulate the Motion:** Create simulations of branching Brownian motions.
- **Plot Paths:** Plot the paths of the motion and save them in JPEG and PNG formats.
- **Export Data:** Export the sample paths to CSV files for further analysis.
- **Generate Animation:** Create an animation of the branching Brownian motion process.

Credits:

- **Contact:** [chenle02@gmail.com](mailto:chenle02@gmail.com) / [le.chen@auburn.edu](mailto:le.chen@auburn.edu)
- **Creation Date:** Created at Tue 23 Jan 2024 04:50:37 PM CST
- **Acknowledgments:** Special thanks to Yimin Zhong ([yzz0225@auburn.edu](mailto:yzz0225@auburn.edu)) and Panqiu Xia ([pqxia@auburn.edu](mailto:pqxia@auburn.edu)) for their helpful discussions.

```
class super_bm_simulation.Branching_BM(num_steps=301, update_steps=100, branching_prob=0.5,  
                                       scale=10, seed=42)
```

Bases: object

Initialize the Super Brownian Motion simulation with given parameters.

#### Parameters

- **num\_steps** (*int*) – Number of steps in the simulation. Default is 301.
- **update\_steps** (*int*) – Number of steps between each update. Default is 100.
- **branching\_prob** (*float*) – Probability of branching at each step. Default is 0.5.
- **scale** (*float*) – Scale factor for the motion. Default is 10.
- **seed** (*int*) – Seed for random number generation. Default is 42.

**Animation**(*dpi=150*)

Generate the animation of the branching Brownian motion.

### **Branch\_or\_Die**(*path\_id*, *step*)

Update the specified path based on the branching and dying logic.

This method applies the branching and dying logic to the path identified by *path\_id* at the given simulation step. It determines whether the path should branch, continue, or die.

#### **Parameters**

- **path\_id** – The identifier of the path to be updated.
- **step** – The current step in the simulation process.

#### **Returns**

A boolean value; True if the path is still alive after this step, False if it has died.

### **One\_Step**(*path\_id*, *step*)

Go one step for a path.

### **export\_paths**()

Export the paths in csv file.

### **plot\_paths**()

Plot all the paths of the Brownian motions.

### **simulate**()

Run the simulation of the Brownian motion with branching.

### **super\_bm\_simulation.main**()

**BIBLIOGRAPHY**
